Math101 - Midterm I

Version A - February 12 Sections: [A01 - A05]

Last Name, First Name:
Lecture Section :
Student ID :

- This examination has 15 problems [12 multiple choice and 3 long answer questions], worth a total of 30.
- It consists of 10 pages, including this one. Make sure your exam copy has the correct number of pages.
- You have 90 minutes to complete the exam.
- Answer each question in the appropriate space immediately below that question. Use the backsides as an extra space for rough work. Show all your work to get full marks. Unsupported correct answers may get zero marks. Also, you must fill the bubble sheet for multiple choice questions.
- No Textbooks, No Class Notes, and No Formula Sheets allowed.
- Only Sharp EL-510R or its variant calculator is allowed. No other calculator allowed.
- No Electronic Communication Device of any sort (e.g. cell phones, laptops, iPods, translators, pagers) are allowed during the exam.

	12 [12]				
Question	1 – 13[13]	14[6]	15[6]	16[6]	Total
Marks					

Q1. Let f(x) be a continuous function whose integral values are given by the table below:

	$\int_{2}^{5} f(x)dx$	$\int_{2}^{4} f(x) dx$	$\int_{5}^{25} f(x)dx$	$\int_{4}^{25} f(x)dx$	$\int_{2}^{25} f(x)dx$	$\int_4^5 f(x) dx$
Value	3	2	5	6	7	1

Using this table, compute $\int_2^5 4t f(t^2) dt$.

(a) 2; (b) 12; (c) 6; (d) 10; (e) 4

Let
$$x = t^2$$
 $\Rightarrow dx = 2t dt$

when $t = 2$, $x = 4$
 $t = 5$, $x = 25$

Q2. During a test a student provided the incorrect answer to the integral

$$\int_{1}^{2} 2\sqrt{x^2 - 6x + 9} dx$$

given by

$$\int_{1}^{2} 2\sqrt{x^{2} - 6x + 9} dx = \int_{1}^{2} 2\sqrt{(x - 3)^{2}} dx = \int_{1}^{2} 2(x - 3) dx = \left(x^{2} - 6x\right) \Big|_{1}^{2} = -8 + 5 = -3$$

Determine the correct answer to the above integral by fixing the student's mistake.

(a) 0; (b) 1; (c) -1; (d) 2; (e) 3
$$2 \int_{1}^{2} (x-3)^{2} dx = 2 \int_{1}^{2} (x-3) dx = -2 \int_{1}^{2} (x-3) dx$$

$$= -2 \left(\frac{\chi^{2}}{2} - 3\pi \right)_{1}^{2}$$

$$= -2 \left[-4 + \frac{5}{2} \right]$$

$$= -2 \left[-4 + \frac{5}{2} \right]$$

Q3. Suppose that f(x) is a twice differentiable function whose values are given by the following table:

x	f(x)	f'(x)		
0	1	5		
2	3	7		

Using this table, compute $\int_{0}^{2} 3x f''(x) dx$.

- ((a)) 36;
- (b) 12; (c) 20;
- (d) 32
- (e) 6

Let
$$u = 3x$$
, $dv = f''(x) dx$

$$\Rightarrow du = 3 dx$$
, $V = f'(x)$

$$\Rightarrow \int_{0}^{2} 3x f''(x) dx = 3x f'(x) \Big|_{0}^{2} - 3 \int_{0}^{2} f'(x) dx$$

$$= 6f'(2) - 3 [f(x)]_{0}^{2}$$

$$= 42 - 3 [f(2) - f(0)]$$

$$= 42 - 3 [3 - 1] = 36$$

- **Q4.** A certain substitution gives $\int \sin^3(x) \cos^n(x) dx = \int (u^9 u^7) du$. Determine n.
 - (a) 1;
- (b) 3;
- (c) 4;
- (d) 5;

$$\int S_{in}^{3} \times C_{o} S_{in}^{4} \times dx = \int S_{in}^{3} \times C_{o} S_{in}^{4} \times dx$$

$$= \int (1 - c_{o} S_{in}^{4}) C_{o} S_{in}^{4} \times (S_{in}^{4}) dx$$
Let $u = c_{o} S_{in} = S_{in} \times dx$

$$\Rightarrow \int \sin^3 x \cos^n x \, dx = -\int (-u^2) u^n \, du$$

$$= \int (u^{n+2} u^n) \, du$$

$$= \int u^n \, du$$

$$= \int u^n \, du$$

- **Q5.** Evaluate $\int_0^{\pi} 8\sin^4(x) dx$.
 - (a) 3π ; (b) π ; (c) $\frac{3\pi}{2}$; (d) $\frac{5\pi}{2}$; (e) $\frac{\pi}{2}$

$$8\int_{0}^{t} \sin^{2}x \cdot \sin^{2}x \, dx = 8\int_{0}^{t} \frac{1-\cos(2x)}{2} \frac{1-\cos(2x)}{2} \, dx$$

$$= 2\int_{0}^{t} \left[1-\cos(2x)\right]^{2} \, dx$$

$$= 2\int_{0}^{t} 1+\cos^{2}(2x) - 2\cos(2x) \, dx$$

$$= 2\int_{0}^{t} 1+\frac{1+\cos(4x)}{2} - 2\cos(4x) \, dx$$

$$= 2\int_{0}^{t} 1+\frac{1+\cos(4x)}{2} - 2\cos(4x) \, dx$$

$$= 2\int_{0}^{t} 1+\frac{1+\cos(4x)}{2} - 2\cos(4x) \, dx$$

- **Q6.** For what values of k does the integral $\int_{0}^{\infty} \frac{dx}{x(\ln(x))^{k+2}}$ converge?

 - (a) $k \ge -1$; (b) k > -1; (c) $k \ge 0$; (d) k > 0; (e) $k \ge 1$

$$=\lim_{b\to\infty} \left\{ \begin{array}{c} b \\ \frac{(\ln x)}{2} \end{array} \right\} \times$$

Let $u = l_u \times l_v \times l_v = l_v \times l_v = l_v \times l_v \times l_v = l_v \times l_v \times l_v = l_v \times l_$

$$= \lim_{b \to \infty} \int_{0}^{b} (u)^{-(k+2)} du \to \emptyset$$

$$\frac{a}{a} = \lim_{k \to \infty} \frac{1}{a} = \lim_{k \to \infty} \frac{1}{a}$$

 $=\lim_{b\to\infty}\frac{u}{-(k+1)}\Big|_{1}^{b}=\lim_{b\to\infty}\frac{-1}{(k+1)}\Big[\frac{1}{b^{k+1}}-1\Big]$

Using (2) as a p-integral and taking k+2>1 for convergence.

- Q7. If you split $\frac{7x^4 4x^3 + 3}{x^3(x^2 + 3)^2}$ into partial fractions, how many coefficients would you have to compute?
 - (a) 2; (b) 5; (c) 9; (d) 7; (e) none of these.

$$\frac{7x^{\frac{4}{5}} + 4x^{3} + 3}{x^{\frac{5}{5}}(x^{\frac{5}{5}} + 3)^{\frac{7}{5}}} = \frac{A}{x} + \frac{B}{x^{\frac{5}{5}}} + \frac{C}{x^{\frac{3}{5}}} + \frac{Dx + E}{(x^{\frac{5}{5}} + 3)^{\frac{5}{5}}} + \frac{Fx + H}{(x^{\frac{5}{5}} + 3)^{\frac{5}{5}}}$$

$$\frac{7}{6} = \frac{A}{x} + \frac{B}{x^{\frac{5}{5}}} + \frac{C}{x^{\frac{3}{5}}} + \frac{Dx + E}{(x^{\frac{5}{5}} + 3)^{\frac{5}{5}}} + \frac{Fx + H}{(x^{\frac{5}{5}} + 3)^{\frac{5}{5}}}$$

- **Q8.** The indefinite integral of $f(x) = \frac{3x^2 + x + 3}{x^3 + x}$ contains, besides the integration constant,
 - (a) only logarithms; (b) logarithms and arctans; (c) arctans and rational functions; (d) only arctans; (e) only rational functions

$$\frac{3x^{2}+x+3}{x(n+1)} = \frac{A}{x} + \frac{Bx+C}{x^{2}+1}$$

$$\Rightarrow 3x^{2}+x+3 = A(x^{2}+1) + (Bx+C)x$$

$$= (A+B)x^{2} + (x+A+C)x$$

$$\Rightarrow A=3, C=1, A+B=3$$

$$\Rightarrow B=0.$$

$$=) \frac{3x^2 + x + 3}{x(x^2 + 1)} = \frac{3}{x} + \frac{1}{x^2 + 1}; logs and arctans$$

Q9. Compute the definite integral:
$$\int_{\ln(2)}^{\ln(3)} \frac{e^x dx}{e^{2x} + 3e^x + 2}.$$

(a)
$$\ln(16/15)$$
; (b) $\ln(15/16)$; (c) $\ln(12/7)$; (d) $\ln(7/12)$; (e) None of these

$$\int_{\eta(x)} dx = e^{x} dx$$

$$\int_{\eta(x)} \frac{e^{x} dx}{(e^{n})^{2} + 3e^{x} + 2} = \int_{u+1}^{3} \frac{1}{u^{2} + 3u + 2} du$$

$$\int_{\eta(x)} \frac{e^{x} dx}{(e^{n})^{2} + 3e^{x} + 2} = \int_{u+1}^{3} \frac{1}{u^{2} + 3u + 2} du$$

$$\int_{u+1}^{3} \frac{1}{(u+1)(u+2)} du$$

$$\int_{u+1}^{u+1}^{3} du$$

$$\int_{u+1}^{3} \frac{1}{(u+1)(u+2)} du$$

$$\int_{u+1}^{3} \frac$$

$$= \int \frac{dx}{x(1+l_{4}x)^{5}} = \int \frac{du}{u^{5}}$$

$$= -\frac{1}{4} \left[\frac{1}{16} - 1 \right]$$

$$= -\frac{1}{4} \left[\frac{1}{16} - 1 \right]$$

$$= \frac{15}{64}$$

Q11. Using the substitution $x + 1 = 2\sin\theta$, we can convert

$$\int 4(3-2x-x^2)^{-\frac{3}{2}} dx$$

to a trigonometric integral, given by:

(a) $\int \tan \theta d\theta$; (b) $\int \sin \theta d\theta$; (c) $\int \sec^3 \theta d\theta$; (d) $\int \sec^2 \theta d\theta$; (e) None of these.

$$\begin{cases}
4 \left[3 - (n^{2} + 2x)\right]^{\frac{3}{2}} dx = 4 \left[3 - (x^{2} + 2x + 1 - 1)\right]^{\frac{3}{2}} dx \\
= 4 \left[3 - (x + 1)^{2} + 1\right]^{\frac{3}{2}} dx
\end{cases}$$

$$= 4 \left[3 - (x + 1)^{2} + 1\right]^{\frac{3}{2}} dx$$

$$= 4 \left[4 - (x + 1)^{2}\right]^{\frac{3}{2}} dx$$

$$= 4 \left[4 - (x + 1)^{2}\right]^{\frac{3}{2}} dx$$

$$= 8 \left[4 - 48 + 20\right] \cos \theta dx$$

$$= 8 \left[4 - 48 + 20\right] \cos \theta dx$$

$$= 8 \left[4 - 48 + 20\right] \cos \theta dx$$

$$= 8 \left[4 - 48 + 20\right] \cos \theta dx$$

- Q12. Find the arc-length of the curve whose equation is $y = \frac{2}{3}(x^2+1)^{3/2}$ for x in the interval
 - [0,2]. Round your answer to two decimal places.

(a)
$$5.23$$
;

$$(d) -6.83$$

$$(e)$$
 7.33

[0,2]. Round your answer to two decimal places.

(a) 5.23; (b) 10.01; (c) 20.44; (d) -6.83 (e) 7.33

[b] Three
$$f'(x) = \frac{2}{3} \cdot \frac{3}{2} (x^{2}+1)^{1/2} (2x)$$

$$f'(x) = \frac{2}{3} \cdot \frac{3}{2} (x^{2}+1)^{1/2} (2x)$$

$$f'(x) = (x^{2}+1)^{1/2} (4x^{2})$$

$$f'(x) = (x^{2}$$

Therefore
$$Arc length = \int \int 1 + (4')^2 dx = \int (2x^2+1) dx$$

$$= \left[\frac{2\kappa^3}{3} + \chi\right]_0^2$$

$$= \frac{16}{3} + 2$$

$$= \frac{22}{3} \times 7.33$$

Q13. Evaluate $\int_0^{\pi} 4x \sin^2(x) dx$.

Rewrite the above using the identity

$$\sin^2(x) = \frac{1 - \cos(2x)}{2}.$$

Then the integral transforms as

$$\int_0^{\pi} 4x \left(\frac{1 - \cos(2x)}{2} \right) dx = \int_0^{\pi} (2x - 2x \cos(2x)) dx = \int_0^{\pi} 2x dx - \int_0^{\pi} 2x \cos(2x) dx$$

The first integral is easy enough to compute. The second requires integrations by parts as

$$u = 2x \qquad du = 2dx$$

$$\downarrow \qquad \uparrow$$

$$dv = \cos(2x)dx \qquad v = \frac{1}{2}\sin(2x)$$

yielding

$$I = x^{2} \Big|_{0}^{\pi} - \left\{ x \sin(2x) \Big|_{0}^{\pi} - \int_{0}^{\pi} \sin(2x) dx \right\}$$

$$= \pi^{2} - 0^{2} - \left\{ 0 - 0 + \frac{1}{2} \cos(2x) \Big|_{0}^{\pi} \right\}$$

$$= \pi^{2} - \frac{1}{2} (\cos(2\pi) - \cos(0))$$

$$= \pi^{2} - \frac{1}{2} (1 - 1)$$

$$= \pi^{2}$$

Q14. Determine whether the following integral

$$\int_{1}^{\infty} \frac{2 - \cos(3x)}{\sqrt{x}} dx$$

converges or diverges. Be sure to justify all inequalities and state all theorems. No marks are given for the answer of "convergence" or "divergence". All marks are based on your argument leading to the correct answer.

Cosine is a bounded function satisfying $-1 \le \cos(u) \le 1$ for any u. As such, we see that the integrand has a lower bound over $[1, \infty)$ given by

$$\frac{2 - \cos(3x)}{\sqrt{x}} \ge \frac{2 - 1}{\sqrt{x}} = \frac{1}{\sqrt{x}}$$

where $x \geq 1$. However, the integral $\int_1^\infty \frac{dx}{\sqrt{x}}$ diverges as it is a type I *p*-integral with $p = 1/2 \leq 1$. Accordingly, by the direct comparison test the original integral diverges as its integrand is bounded below by a function whose integral diverges on those bounds.

- **Q16.** Recall that a sphere of radius a > 0 has volume $V = \frac{4}{3}\pi a^2$. Let's verify this result in two different ways, as follows:
 - a) Using the method of Disks (and not using any other method), find the volume of the solid of revolution that is obtained by revolving the semi-circle $y = \sqrt{a^2 x^2}$ around the x-axis.

With disks around x-axis:

$$V = \int_{-a}^{a} \pi \underbrace{(a^2 - x^2)}_{\text{disk radius}^2} dx = \pi \cdot \left(a^2 x - \frac{1}{3} x^3\right) \Big|_{x = -a}^{x = a} = \frac{4}{3} \pi a^3.$$

b) Using the method of Cylinderical Shells (and not using any other method), find the volume of the solid of revolution that is obtained by revolving the semi-circle $x^2 + y^2 = a^2, x \ge 0$ around the y-axis.

With shells around y-axis:

$$V = \int_0^a 2\pi \cdot \underbrace{x}_{\text{shell radius}} \cdot \underbrace{2\sqrt{a^2 - x^2}}_{\text{shell height}} dx = 4\pi \int_0^a x\sqrt{a^2 - x^2} dx$$

Here one hopes nobody tries IBP which makes this a bit of a mess either way one chooses the factors. Instead, one either subs the "obvious" $u = a^2 - x^2$ to get

$$= 4\pi \int_{a^2}^{0} u^{1/2} \frac{du}{-2} = -\frac{4\pi}{3} u^{3/2} \Big|_{u=a^2}^{u=0} = \frac{4\pi}{3} a^3$$

or a trig substitution $x = a \sin(\theta)$ makes it

$$= 4\pi \int_0^{\pi/2} a \sin(\theta) \cdot a \cos(\theta) \cdot a \cos(\theta) d\theta = 4\pi a^3 \int_0^{\pi/2} \cos^2(\theta) \sin(\theta) d\theta$$
$$= 4\pi a^3 \cdot \left(-\frac{1}{3} \cos^3(\theta) \right) \Big|_{\theta=0}^{\theta=\pi/2} = \frac{4\pi}{3} a^3$$
